	Urgent	Not Urgent
Important	Do - MVP ● Save workout info in a csv file for easy readability and manageability by a java program (file I/O). ● Pull recent workout history to suggest today's workout based on what workout hasn't been done recently. ● Make the program work from the terminal (system I/O).	Schedule - V2.0 ● Implement a "daily feel" where soreness in different areas makes certain workouts more or less likely to be recommended. ● Make the program able to suggest any time or difficulty for a pre-given list of workouts based on recent workout history and current soreness, rather than the same time or difficulty that would have to be given by the user. ● Add a field for workouts that the user enjoys and another for workouts that they don't like, so that given the choice between two similar workouts the more liked one would automatically be chosen by the program. ● Suggest warm up and cool down stretches & exercises depending on the workout
Not Important	Delegate - Use Library ● Add weather reports for the day/week ● Use real-world map data to suggest an actual route to run the workout on (if possible, idk it sounds cool). For example if the program suggests an interval hill sprint workout, it could suggest I run to and around Slayter hill in a google maps style gui interface. ● Pull data from the internet about upcoming races that the user might want to know about	Delete ● Add something about nutrition after workouts for the best recovery ● Make it competitive by adding the ability to store other people's workout stats and compare them to yours. ● Do this but for more than just running workouts. Add in weightlifting and other things.
